Functions that are universal with respect to the Faber-Schauder system

Martin Grigoryan, Tigran Grigoryan

Abstract. We prove that there is a function $U \in C[0,1]$, such that: for any $\varepsilon > 0$ there exists a measurable set $E \subset [0,1]$, with measure $|E| > 1 - \varepsilon$ such that for any function $f(x) \in C[0,1]$, one can find a function $g(x) \in C[0,1]$ equal to $f(x)$ on $E$ such that its Fourier series with respect to the Faber-Schauder system converges uniformly on $[0,1]$, and $A_k(g) = A_k(U), k \in \text{Spec}(g)$, (where $A_k(g)$ -coefficients of Fourier of function $g(x)$ with respect to the Faber-Schauder system)

Keywords: Faber-Schauder system, Fourier series

I. INTRODUCTION
Numerous works of famous mathematicians G. Birkhoff, J. Marcinkiewicz, G. MacLane, S. Voronin, K. Grosse–Erdman and others (see [1]-[5]) are devoted to the existence of functions, which are universal in different senses. Let's note some results obtained in that direction.

The first type of universal function was considered by G. Birkhoff [1] in 1929. He proved, that there exists an entire function $g(z)$, which is universal with respect to translations, i.e. for every entire function $f(z)$ and for each number $r > 0$ there exists a growing sequence of natural numbers $\{n_k\}_{k=1}^\infty$, so that the sequence $\{g(z + n_k)\}_{k=1}^\infty$ uniformly converges to $f(z)$ on $|z| \leq r$.

Marcinkiewicz [2] proved that for any nonzero sequence $\{h_k\}_{k=1}^\infty$ there exists a continuous function $F : [0,1] \rightarrow R$ with the following property: for any measurable function $\phi : [0,1] \rightarrow R$, there is a subsequence $\{h_{n_k}\}_{k=1}^\infty$ of $\{h_n\}_{n=1}^\infty$ such that

$$\lim_{k \rightarrow \infty} \frac{F(x + h_{n_k}) - F(x)}{h_{n_k}} = \phi(x) \text{ a.e. on } [0,1].$$

In 1952 G. MacLane [3] proved a similar result for another type of universality, namely, there exists an entire function $g(z)$ which is universal with respect to derivatives, i.e. for every entire function $f(z)$ and for each number $r > 0$ there exists a growing sequence of natural numbers $\{n_k\}_{k=1}^\infty$, so that the sequence $\{g^{(n_k)}(z)\}_{k=1}^\infty$ uniformly converges to $f(z)$ on $|z| \leq r$.

In 1975 S. Voronin [4] proved the universality theorem for the Riemann zeta function $\zeta(s)$, which states that any nonvanishing analytic function can be approximated uniformly by certain purely imaginary shifts of the zeta function in the critical strip.

In 1987 K. Grosse–Erdman [5] proved the existence of infinitely differentiable function with universal Taylor expansion, namely, there exists a function $g \in C^\infty(R)$ with $g(0) = 0$, such that for every function $f \in C(V)$ with $f(0) = 0$ and for each number $r > 0$ there exists a growing sequence of natural numbers $\{n_k\}_{k=1}^\infty$, so that the sequence

$$S_{n_k}(g,x) = \sum_{m=1}^{n_k} \frac{g^{(m)}(0)}{m!} x^m$$

uniformly converges to $f(x)$ on $|x| \leq r$.

We recall the definition of the Faber-Schauder system (see [6]):

$$\{\varphi_n(x) : n = 0,1,\ldots\}, x \in [0,1],$$

where

\[ \varphi_0(x) = 1, \]
\[ \varphi_1(x) = x \quad \text{and for} \]
\[ n = 2^i + i; \quad k = 0, 1, \ldots; \quad i = 1, 2, \ldots, 2^i : \]
\[ \varphi_n(x) = \varphi_0(x) \quad \text{if} \quad x = x_n \quad \text{and} \quad \varphi_n(x) = \left\{ \begin{array}{ll}
0 & \text{if } x \not= \left( \frac{i-1}{2}, \frac{i}{2^i} \right), \\
1 & \text{if } x = x_n = \left( \frac{i-1}{2}, \frac{i}{2^i} \right) \frac{2-i}{2^i+1},
\end{array} \right.
\]

For \( 2 \leq n = 2^i + i \) we set \( \Delta_n = \Delta_{i+1} = \left( \frac{i-1}{2^{i+1}}, \frac{i}{2^{i+1}} \right) \).

For \( A_n = A_n^{(i)} = \left( \frac{i-1}{2^i}, \frac{i}{2^i} \right) \) the set of points, where the function \( \varphi_n(x) \) is different from zero.

We also recall that the Faber-Schauder system forms a basis in the space \( C[0,1] \) (see [7]) that is, any function \( f \in C[0,1] \) can be uniquely represented by the series Fourier

\[ f(x) = \sum_{n=0}^{\infty} A_n(f) \varphi_n(x) \]

with respect to the Faber-Schauder system, which converges to \( f \) uniformly on \( [0,1] \). The \( A_n(f) \) coefficients of this series are defined by \( A_0(f) = f(0), \quad A_1(f) = f(1) - f(0), \quad A_n(f) = A_{n-1}(f) = f \left( \frac{2i-1}{2^{i+1}} - \frac{i-1}{2^i} \right) + f \left( \frac{i}{2^i} \right) \).

There are number of interesting results on the properties of the Faber-Schauder system (see [7-16]).

**Definition 1.** A basis \( \{ f_k : k = 1, 2, \ldots \} \) of a Banach space \( B \) is said to be unconditional if for an arbitrary permutation \( \{ \sigma_k : k = 1, 2, \ldots \} \) of the natural numbers, the system \( \{ f_{\sigma(k)}(x) : k = 1, 2, \ldots \} \) is also a basis of \( B \).

Let \( E \subset [0,1] \) be a measurable set and let \( C(E) \) be the class of all continuous functions defined on \( E \), and let \( b_n(x) \in C(E), \quad n = 1, 2, \ldots \).

**Definition 2.** The series \( \sum_{n=0}^{\infty} b_n(x) \) is said to be unconditionally convergent to \( f(x) \) in \( C(E) \) if for any permutation \( \{ \sigma(k) : k = 1, 2, \ldots \} \) of the natural numbers, the series \( \sum_{n=0}^{\infty} b_{\sigma(n)}(x) \) converges to \( f(x) \) uniformly on \( E \).

**Definition 3.** The system \( \{ f_k : k = 1, 2, \ldots \} \) is said to be an unconditional system of the representation of functions in the class \( C(E) \) if for every function \( f(x) \in C(E) \) there exists a series \( \sum_{n=0}^{\infty} a_n f_n(x) \) such that it unconditionally converges to \( f(x) \) in \( C(E) \).

We note that in the space \( C[0,1] \) there exists no unconditional basis (see [10]).

And what is more, in the article [3] M. G. Grigorian and A. A. Sargsyan, constructed a continuous function \( f_0(x) \in C[0,1] \) and a permutation \( \{ \sigma(k) : k = 1, 2, \ldots \} \) of natural numbers, such that the series \( \sum_{k=0}^{\infty} A_{\sigma(k)}(f_0) \varphi_{\sigma(k)}(x) \) diverges in measure on \( [0,1] \) and \( \int_{[0,1]} \left| \sum_{k=0}^{n} A_{\sigma(k)}(f_0) \varphi_{\sigma(k)}(x) \right| \mathrm{d}x \to \infty \) as \( n \to \infty \).

Now we recall the definition of the greedy algorithm.

Let \( \Psi = \{ \psi_k \}_{k=1}^{\infty} \) be a normalized basis in Banach space \( D(f,\psi) \). Then for each element \( f \in X \) there exists a unique series by system \( \Psi = \{ \psi_k \}_{k=1}^{\infty} \), converging to \( f \) in the norm of space \( X \):

\[ f = \sum_{k=0}^{\infty} c_k \psi_k \]

Let an element \( f \in X \) be given. We call a permutation \( \sigma = \{ \sigma(k) : k = 1, 2, \ldots \} \) of nonnegative integers decreasing and write \( \sigma \in D(f,\psi) \) if

\[ \left| c_{\sigma(k)}(f) \right| < \left| c_{\sigma(k-1)}(f) \right| \quad \text{for } k > 1. \]

In the case of strict inequalities here \( D(f,\psi) \) consists of only one permutation.

We define the m-th greedy approximant of \( f \) with regard to the basis \( \Psi \) corresponding to a permutation by formula
Note the following question, which arises when we investigate the convergence of the greedy algorithm for the new, corrected function $e f(x)$ and is also of independent interest. Can the values of any function $f(x)$ in $L^p[0,1]$, $p>1$, be modified on a set of small measure so that all the nonzero elements in the sequence of the Fourier coefficients of the function thus obtained with respect to the classical systems (in particular, the Walsh and trigonometric systems) are arranged in decreasing order?

It is important to note that, as was shown in the article [20], M. G. Grigoryan, K. S. Kazaryan and F. Soria, there exist a complete orthonormal system $\Phi = \{f_k(x)\}_{k=1}^\infty$ and a function $f \in L^p[0,1]$, $p>2$, such that if $g(x)$ is any function in $L^p[0,1]$, $p>2$ with measure $|x| \in [0,1], g(x) = f(x)| > 0$ then it's greedy algorithm with respect to the system $\Phi = \{f_k(x)\}_{k=1}^\infty$ diverges in $L^p[0,1]$, $p>2$.

Note also that well-known classical theorems by N. N. Luzin and D. E. Men'shov "on correction" of functions (see [22,23]). We have considered the behavior greedy algorithm after modification of functions (see [19-22]).

For Haar system we obtained:

For any $\varepsilon>0$ there exists a measurable set $E \subset [0,1]$, with measure $|E| > 1-\varepsilon$ such that for any function $f(x) \in L^p[0,1]$ one can find a function $g(x) \in L^1[0,1]$ equal to $f(x)$ on $E$ such that its greedy algorithm with respect to the Haar system converges to $g(x)$ in the $L^1[0,1]$-norm.

In the paper [8] M. G. Grigoryan and A. A. Sargsyan was obtained

**Theorem 1.** For any $\varepsilon>0$ there exists a measurable set $E \subset [0,1]$, with measure $|E| > 1-\varepsilon$ such that for any function $f(x) \in C[0,1]$ one can find a function $g(x) \in C[0,1]$ equal to $f(x)$ on $E$ such that its greedy algorithm with respect to the Faber-Schauder system converges to $g(x)$ uniformly on $[0,1]$.

But, nevertheless, for every $0<\varepsilon<1$ there exists a measurable set $E \subset [0,1]$ with measure $|E| > 1-\varepsilon$, such that the Faber-Schauder system is an unconditional system of representation of functions of the class $C(E)$ (see [14]). This result is a consequence of the more general Theorem 1 (see [9]), which is stated as follows:

**Theorem 2.** For every $\varepsilon>0$ there is a measurable set $E$ contained in $[0,1]$, with $|E| > 1-\varepsilon$ such that for each $f \in C(E)$ one can find a function $g \in C[0,1]$, $g(x) = f(x)$, $\forall x \in E$ equal to $f$ on $E$ such that the Fourier series with respect to the Faber-
Schauder system of signal g unconditionally converges it in the $C[0,1]$-norm and

$$\sum_{n=0}^{\infty} |A_n(g)\|\phi_n(x)\| < 2 \|g(x)\|, \forall x \in [0,1], \forall m > 0.$$  

II. PROOF OF THEOREMS

In this article we prove the following theorems.

IIa. RESULTS

**Theorem 3.** Corresponding to each $f \in C[0,1]$ there is a Schauder series that converges to $f$ on a set of full measure, such that for every $\varepsilon > 0$ there is a measurable set $E$ contained in $[0,1]$, with $|E| > 1 - \varepsilon$, on which the series converges unconditionally to $f$ in $C(E)$.

Of course, these results can not be improved by replacing the set $E$ with $[0,1]$, since as Karlin has shown, there is no unconditional basis for $C[0,1]$ (see [10]).

This theorem is a consequence of the more general Theorem 4, which is stated as follows:

**Theorem 4.** There is a function $U \in C[0,1]$, such that

For any $\varepsilon > 0$ there exists a measurable set $E \subset [0,1]$, with $|E| > 1 - \varepsilon$ such that for any function $f(x) \in C[0,1]$ one can find a function $g(x) \in C[0,1]$ equal to $f(x)$ on $E$ such that its Fourier series with respect to the Faber-Schauder system converges uniformly on $[0,1]$, and $|A_n(g)| = A_n(U), k \in \text{Spec}(g)$

IIb. PROOF OF THE THEOREM 4

Let $0 < \varepsilon < 1$ and $\Phi$ be the set of all the algebraic polynomials with rational coefficients. Let us enumerate the elements of $\Phi$ and represent them as a sequence

$$\Phi = \{f_j(x)\}_{j=1}^{\infty}$$  

An application of Lemma 2 in the paper [13] as regards the sequence leads to some sequences of functions $\{g_j(x)\}_{j=1}^{\infty}$, polynomials

$$g_j(x) = \sum_{n=m_j+1}^{\infty} A_n(U)\phi_n(x), \quad U \in C[0,1]$$

and a sequence $\{E_j\}_{j=1}^{\infty}$ are measurable subsets of $[0,1]$ which satisfy the following conditions for all $j=1, 2, 3, \ldots$:

$$g_j(x) = f_j(x) \text{ on } E_j$$  

$$|E_j| > 1 - \frac{1}{4^j}$$

$$|\frac{g_j(x) - Q_j(x)}{}| < \frac{1}{4^j} \varepsilon, x \in [0,1]$$

$$\sum_{n=m_j+1}^{\infty} |A_n(U)|\phi_n(x)\| < 2^{-j}, \forall x \in [0,1], \forall q \geq 1$$

We set

$$E = \bigcap_{k=1}^{\infty} (E_k), n_0 = -\log_2 \varepsilon + 2.$$  

Obviously

$$|E| > 1 - \varepsilon$$

Let $f(x) \in C[0,1]$ be given.

It is easy to see that we can select subsequence $\{f_{i_j}(x)\}_{j=1}^{\infty} \subset \Phi = \{f_j(x)\}_{j=1}^{\infty}$ such that

$$|f_{i_j}(x)| \leq \frac{1}{4^j} \varepsilon, \forall x \in [0,1], \forall k \geq 2.$$  

Proceeding thus inductively, one determines a subsequence $\{Q_{i_q}(x)\}_{q=1}^{\infty}$ a sequence of functions $\{\beta_q(x)\}_{q=1}^{\infty}$, $\{\beta_q(x) = f_{i_q}(x) + g_{i_q}(x) - f_{i_q}(x)\}_{q=1}^{\infty}$ which satisfy the following conditions for all $q=1, 2, 3, \ldots$

$$\lim_{n \to \infty} \sum_{j=1}^{n} |Q_{i_q}(x) - \beta_q(x)| = 0 \text{ uniformly on } [0,1],$$  

$$|\beta_q(x)| \leq \frac{1}{4^q} \varepsilon, \forall x \in [0,1], \forall q \geq 1,$$

$$\beta_q(x) = f_{i_q}(x), \forall x \in E_q, \forall q \geq 1,$$

$$\sum_{n=m_{i_q}+1}^{\infty} |A_n(U)|\phi_n(x)\| < 2^{-q}, \forall x \in [0,1], \forall q \geq 1$$

Let

$$g(x) = \sum_{q=1}^{\infty} \beta_q(x)$$

Obviously

$$g(x) = \sum_{q=1}^{\infty} \beta_q(x) \in C[0,1],$$

$$\sum_{q=1}^{\infty} \beta_q(x) = f(x) \text{ on } [0,1].$$
\[ g(x) = f(x), \forall x \in E \]

It is easy to see that the series
\[ \sum_{q=1}^{\infty} \sum_{n=a_{q+1}+1}^{a_q} A_q(U) \varphi_n(x), \]
unconditionally converges to \( g(x) = \sum_{q=1}^{\infty} \beta_q(x) \) in the C[0,1]-norm and therefore
\[ |A_q(g)| = |A_q(U)|, \forall n \in \text{spec}(g) = \{ n \in \mathbb{N}, A_q(g) \neq 0 \} \]

IIc. REMARK

Repeating the argument in the proof theorem 3 we arrive at following Theorem

Theorem 5. There is a Schauder universal series of the form \( \sum_{i=1}^{\infty} b_i \varphi_n(x), |b_i| \leq 0 \) with the following properties:

1. For each measurable function \( f(x) \) one can find a sequence \( \{ \xi_n \}_{n=1}^{\infty}, \xi_n = 0, \text{or } 1, k = 1, 2, ..., \) such that the series \( \sum_{n=1}^{\infty} \xi_n b_i \varphi_n(x) \) converges unconditionally to \( f \) almost everywhere on \([0,1] \).

2. For every \( \varepsilon > 0 \) there is a measurable set \( E \) contained in \([0,1]\), with \( |E| > 1 - \varepsilon \), such that for each \( f \in C(E) \) one can find a function \( g \in C[0,1], g(x) = f(x), \forall x \in E \) equal to \( f \) on \( E \) such that the Fourier series with respect to the Faber-Schauder system of signal \( g \) unconditionally converges in the C[0,1]-norm, and
\[ A_q(g) = b_q, \forall n \in \text{spec}(g) = \{ n \in \mathbb{N}, A_q(g) \neq 0 \} \]
\[ \sum_{n=0}^{\infty} |A_q(g)| \varphi_n(x) < 2 |g(x)|, \forall x \in [0,1], \forall m > 0. \]
